

Experiment 01:-

Problem Statement:-

Write a Python program that calculates the area of a circle when the radius is provided by the user. Use $\pi = 3.14$ and display the area.

Algorithm:-

1. Start
2. Read the radius r from the user
3. Calculate the area using the formula:
 $\text{Area} = 3.14 \times r \times r$
4. Display the area
5. Stop.

Flowchart:-

Execution:-

The screenshot shows the CDE TANTRA IDE interface. On the left, the problem statement is displayed: "1.1.1. Area of Circle. Write a Python program that calculates the area of a circle when the radius is provided by the user. Use $\pi = 3.14$ and display the area." Below this, the input and output formats are specified. The input format is "A single line containing a floating-point number representing the radius." The output format is "Print the computed area of the circle formatted to 4 decimal places." The main editor on the right contains the following Python code:

```
1 #Write your code here...
2 radius = float(input())
3 area = 3.14 * radius * radius
4 print(f"{area:.4f}")
```

At the bottom, there are buttons for "Terminal", "Test cases", "Prev", "Reset", "Submit", and "Next".
