

Problem Statement:-

Write a Python program to calculate the area of a rectangle given its length and width.

Algorithm:-

1. Start.
2. Read the length l and Width b from the user.
3. Calculate the area using the formula:
 $\text{Area} = l * b$.
4. Display the area.
5. Stop.

Flowchart:-**Execution:-**

The screenshot shows a web-based IDE interface for C++DEVTANTRA. The main window displays a Python program titled '1.1.2. Area of Rectangle'. The program's purpose is to calculate the area of a rectangle given its length and width. The formula used is $\text{Area of Rectangle} = \text{Length} \times \text{Width}$. The input format specifies two lines of input: the first for length and the second for width. The output format requires the area to be printed as a float value formatted to two decimal places. The code editor on the right shows the following Python code:

```
1 # Type Content here...
2 length = float(input())
3 width = float(input())
4 area = length * width
5 print(f"{area:.2f}")
```

At the bottom, there are buttons for 'Terminal', 'Test cases', 'Debugger', 'Submit', 'Reset', and 'Next'.
